

# Protective glass Overlays

A protective glass is suitable for all areas in which a display can be damaged or get dirty by accidental or deliberate contact. With our protective glass overlays, displays of all sizes get a secure front glass and a sturdy metal frame to protect the panel.

As standard, our protective glass overlays are equipped with single-pane safety glass (SPSG). This thermally tempered white glass is much more resistant than conventional glass due to its special production. Should the pane give way, it shatters into small blunt-edged pieces, which reduces the risk of an injury.

Optionally, laminated safety glass (LSG) can be used. Laminated safety glass consists of at least two flat glass panes, which are bonded with a highly tear-resistant, elastic intermediate layer made from a film, so if the glass breaks, glass splinters adhere to the film. Their use is particularly recommended for higher-mounted displays to prevent falling glass splinters in case of damage.

## Characteristics

- Steel frame with black powder coating
- Thermally tempered white glass 4 to 6 mm (SPSG) depending on display size
- Optionally also with laminated safety glass (LSG)
- Optionally with anti-reflective foil or anti-vandalism foil
- Easy installation, even on already installed displays

## Applications

Fairs and exhibitions

Digital signage

Interactive advertising space

Presentation areas in conference rooms

Visitor information systems, e.g. for bus and train, shopping malls, airports or museums

Check-in service

Training rooms
